Dear Survey Respondent,

The aim of this survey is to provide a comprehensive overview of etiological hypotheses related to testicular cancer raised by results from basic research or other research as based on a survey of experts invited to attend the Copenhagen CIS meeting. We are interested in etiology (the causes of disease) and not in pathogenesis (how cancers develop). A voting system will be used to rate the importance of the hypotheses at the meeting. The panel will also consider the feasibility of testing each hypothesis in an epidemiologic study.

Please note: any potential risk factor for testicular cancer in a broad sense (i.e. infantile and among adults, any histology) is of interest. However, we explicitly exclude SNPs from this survey.
